

PROMPT - Take-home

You are part of the Advanced Analytics team at Airbnb which focuses on host success.

Recently the team has observed an increase in occupancy trends but the reason behind this is unknown. The team has made no major product changes and are reaching out to you to better understand why.

For clarification:

1. Definition of occupancy is the # of booked nights / # of available or booked nights
2. Each row in the dataset represents monthly metrics for a host and each host can have multiple listings

Once you complete your analysis, summarize your findings and recommendations in about 5 slides with relevant visualizations that can be understood by an executive with limited context.

Please follow the instructions below:

- The timeline for turning it around is 24 hours from the time of delivery.
- You are free to use whatever tools you are most comfortable with to work through the analysis, as long as your analytical approach is easy to follow.
- Please save and attach your project in its entirety in one PDF document, including any code that you produce and any slides.
- Please don't share or publish the data.

There is no "right" answer to this question. We are simply interested in seeing your data-driven reasoning and business insights, so feel free to be creative!
